

DSG-0AM (DQ200) Modular Test Stand Design

All-in-One “Plug n Play” system with HTC Controller built-in and Windows 10 Tablet
Pre-written test scripts included to ensure a true and comprehensive check for the following faults:

- Poor Pump performance
 - Pump Motor degradation
 - Pressure loss due to cracked housing
 - Solenoid Ampere check and more commonly, critical mechanical performance issues
 - External leaks from K1 & K2 actuator seals
 - Internal leaks from Clutch fork actuators seals
-
- The HTC allows graphical viewing comparisons to data captured from a new unit
 - Easy to see errors in both pressure and ampere results
 - Printable result graphs and file storage capability for all tests performed

The test stand was designed by popular demand from existing customers. Originally the front section stand connected directly to HTC controllers used on VBT, Solenoid and Dyno machines. Phase two development was the full control centre which attaches behind. This makes it an ‘all-in-one’ product for new and existing customers alike.

This exciting tool costs less than a handful of OE replacements. Avoid any costly comebacks and be confident in the product you rebuild by ordering your DSG-0AM (DQ200) Test System NOW
